

## Do you know Test in the City?

It is a **screening project**, organised in collaboration with different Italian cities, which offers the opportunity **to be tested free** of charge for three viruses that, if not detected in time and not treated, are responsible for diseases that can have serious health consequences.

We are talking about **HCV**, a virus that can cause Hepatitis C, **HBV**, a virus that can cause Hepatitis B, and **HIV**, a virus that can cause AIDS. Sometimes HBV can lead to infection with HDV, the virus that causes the most severe form of the disease, Hepatitis delta.

These viruses **are transmitted** from infected person to healthy person through blood exchange, unprotected sexual intercourse and also from mother to child during pregnancy or at birth.

**The test is reliable, anonymous** and is carried out by finger-prick testing with a drop of blood from the fingertip **and gives results in few minutes**.

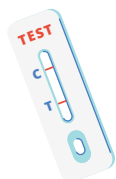

## Why is it important to know if you are infected?

Unfortunately, all three of these infections may give no symptoms for many years, so a person may have become infected without knowing it.

Fortunately, there are **very effective and free drugs** that eliminate, block or keep these viruses under control, preventing you from becoming seriously ill or infecting others.

For all these reasons, it is important to get tested and find out as soon as possible if you have been infected and to receive assistance.

Go to **[www.testinthecity.com](http://www.testinthecity.com)**, you will find the places where you can get tested and get all the information you need to make a responsible choice.

**Don't miss this opportunity!**  
**Come and get tested for your health and the health of others!**
